Pegasos Email Marketing Software

Testing

This guide covers how to test the application locally, share it with remote testers using ngrok, and deploy to production on Hostinger VPS when ready.

1. Local setup (your PC)

Requirements: Python 3.12+, Node.js 18+, SendGrid API key.

First-time install

- Open PowerShell in the project folder

- Run: s

Start the app

- Run: scripts\windows\start.bat

- Backe

2. Remote testing with ngrok (no deploy)

Use this when someone far away should test in their browser without installing anything. Your PC must stay on while they test.

One-time ngrok setup

- Sign up at https://ngrok.com and download ngrok for Windows

- Run: n

Prepare .env for ngrok

Add to .env:
DEBUG=True
ALLOWED_HOSTS=localhost,127.0.0.1,.ngrok-free.app,.ngrok.io
SITE_URL=http://localhost:8000

Steps each time you share

- Run scripts\windows\start.bat (wait for backend + frontend)

- Run sc

- Restart frontend (Ctrl+C, then npm start in email-marketing-frontend)

- Share

3. Portable ZIP (tester installs on their PC)

- Zip project excluding .venv, node_modules, db.sqlite3

- Send .

4. Email deliverability checklist

- SendGrid: verify domain (pegasos.in) and sender gunaseelan@pegasos.in

- Hostin

5. Deploy on Hostinger VPS (when ready)

- Buy Hostinger VPS with Ubuntu 22.04 or 24.04 (Plain OS, not shared hosting)

- Install

6. Troubleshooting

- ngrok login fails remotely: set REACT_APP_API_BASE_URL in .env.local, restart frontend

- Django

7. Security reminders

- Never commit .env or share API keys publicly

- Use a
